Getting Started

Create an Algolia account

1. Create your Algolia account. The sign-up wizard will guide you through Algolia’s onboarding process.
   Pay extra attention to choosing your Algolia datacenter. Select the one which is the closest to your datacenter.

2. Once you are logged into dashboard, get your Algolia credentials from the “Settings > API Keys”
Install the extension

There are two ways how to install the extension:

1. Magento Marketplace

Navigate to Magento Marketplace and get the extension. After that navigate to your Magento administration and install the extension by following this guide.

2. Composer

   $ composer require algolia/algoliasearch-magento-2
   
   $ bin/magento module:enable Algolia_AlgoliaSearch
   
   $ bin/magento setup:upgrade
   
   $ bin/magento setup:static-content:deploy

Configure Algolia credentials

When you have the extension installed, navigate to Stores > Configuration > Algolia Search administration panel. There locate Credentials & Basic Setup tab and configure your Algolia credentials.

** Application ID, Search-only (public) API Key and Admin API Key will be available on Algolia dashboard under API Keys section
These configurations are sufficient for getting the extension to index the Magento products to Algolia. For setting up any further extension configuration please refer to the Official documentation.

Initial indexing

Force the re-indexing of all sections you want to synchronize with Algolia. In your console run command:

```
$ bin/magento indexer:reindex algolia_products algolia_categories algolia_pages algolia_suggestions algolia_additional_sections
```

This command will trigger reindexing on all your content.

**Congratulations!** You just installed Algolia extension to your Magento 2 store!
