

Advanced Fields For Magento 2

Advanced Fields for Magento 2 gives Admins, Designers and Developers the ability to create as many additional fields for text and file data (such as pictures, video and PDF files) for use as custom content blocks on CMS pages as needed. Advanced Fields provides 4 types of fields.

1. Text
2. Text area
3. Wysiwyg Editor
4. File

1. Add Advanced Fields By Default On A Magento Page

Users can add custom inputs to a CMS page by default, for example below is a block being added to a CMS Home Page.

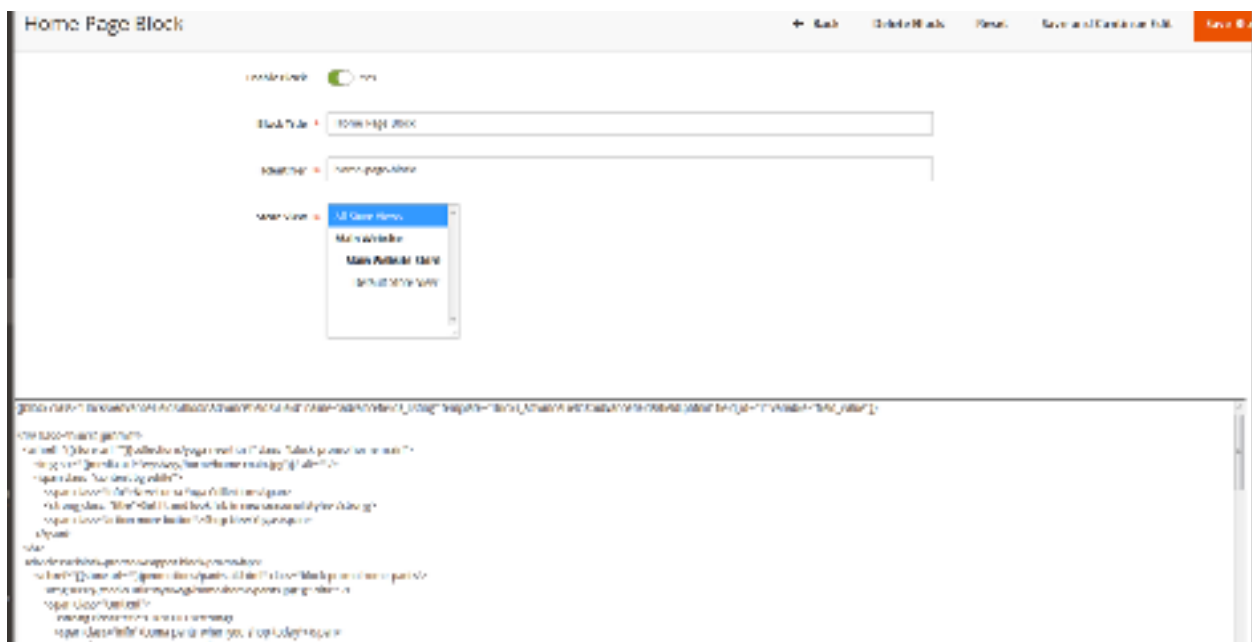

To add a new custom field to the homepage simply:

1. Created new custom field under Advanced Fields > Bricks Advanced Fields > Add New
2. After creating the fields go to Content > Blocks > Home Page Block > Edit
3. To add custom block to the top of the page you can use the following short code:

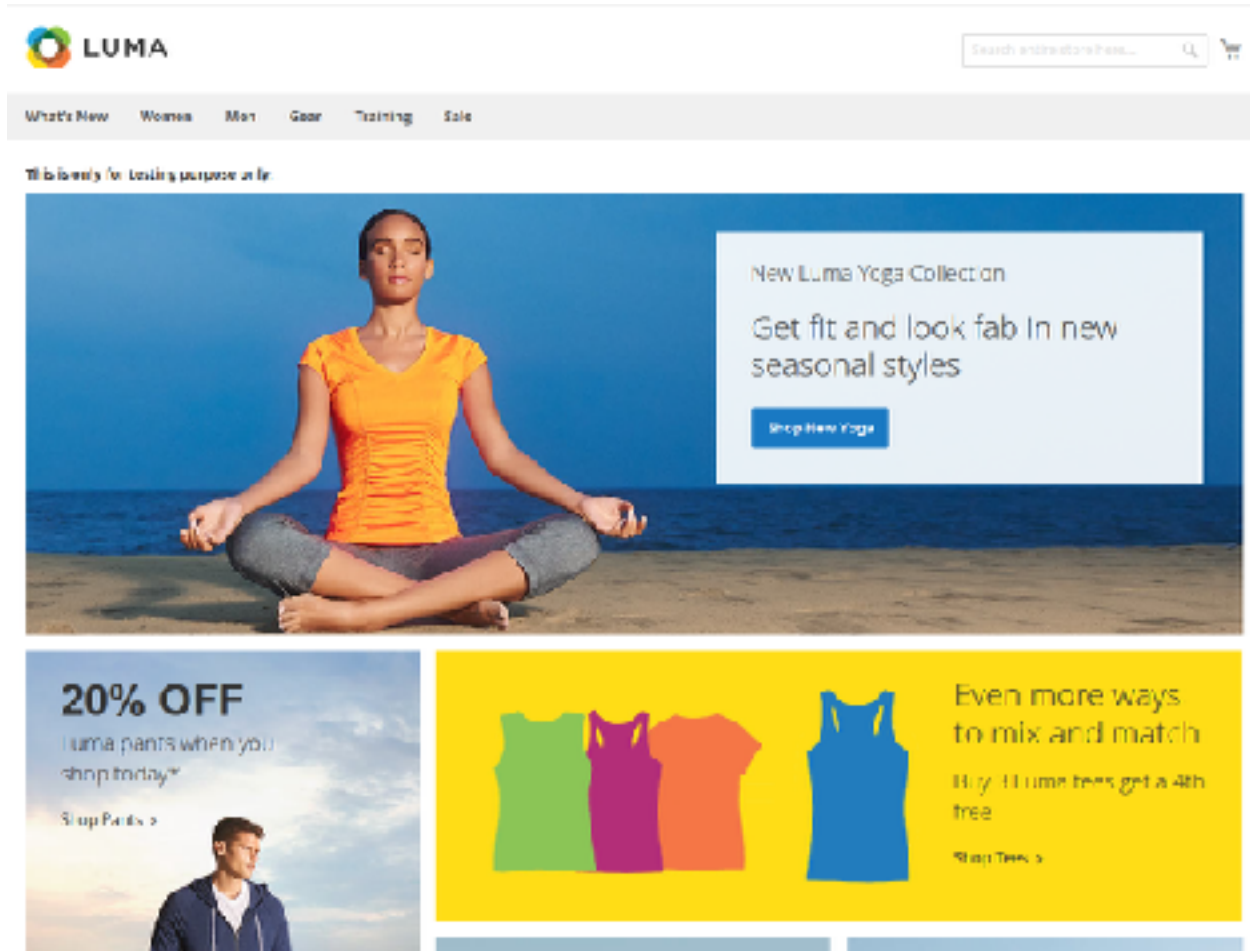

1. `{{block class="Bricks\AdvanceFields\Block\Advancefields\Field" name="advancefields_listing" template="Bricks_AdvanceFields::advancefields/field.phtml" field_id="1" variable="field_value"}}`

2. Where field_id is the id of field which you want to show on the home page.

4. The variable can be edited to field_value to show custom field value or you can use field_title to show the field title.

For example above code will add new field with the id 1 and show field_value on the homepage as shown below.

Suppose you want to add both field title and field value then you have to add below code

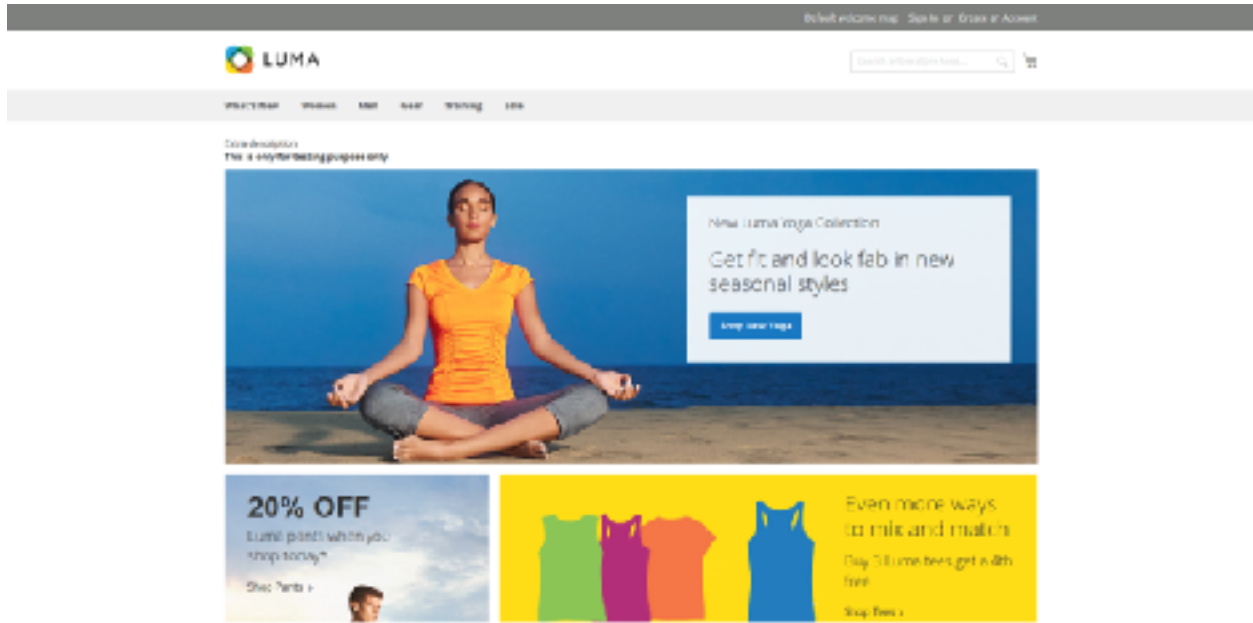

```
{{block class="Bricks\AdvanceFields\Block\Advancefields\Field" name="advancefields_listing" template="Bricks_AdvanceFields::advancefields/field.phtml" field_id="1" variable="field_title"}}
```

```

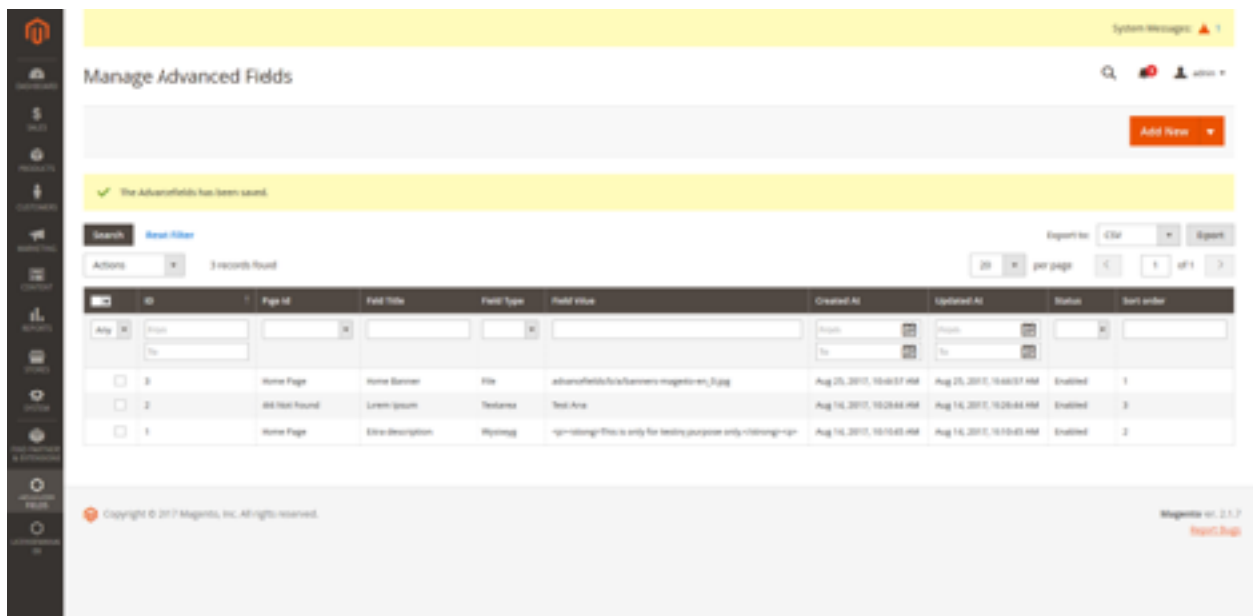

{{block class="Bricks\AdvanceFields\Block\Advancefields\Field"
name="advancefields_listing" template="Bricks_AdvanceFields::advancefields/field.phtml"
field_id="1" variable="field_value"}}

```

After adding the above code both the field title and field value will be displayed

In this same manner, we can add images as custom banner in the custom fields. For example:

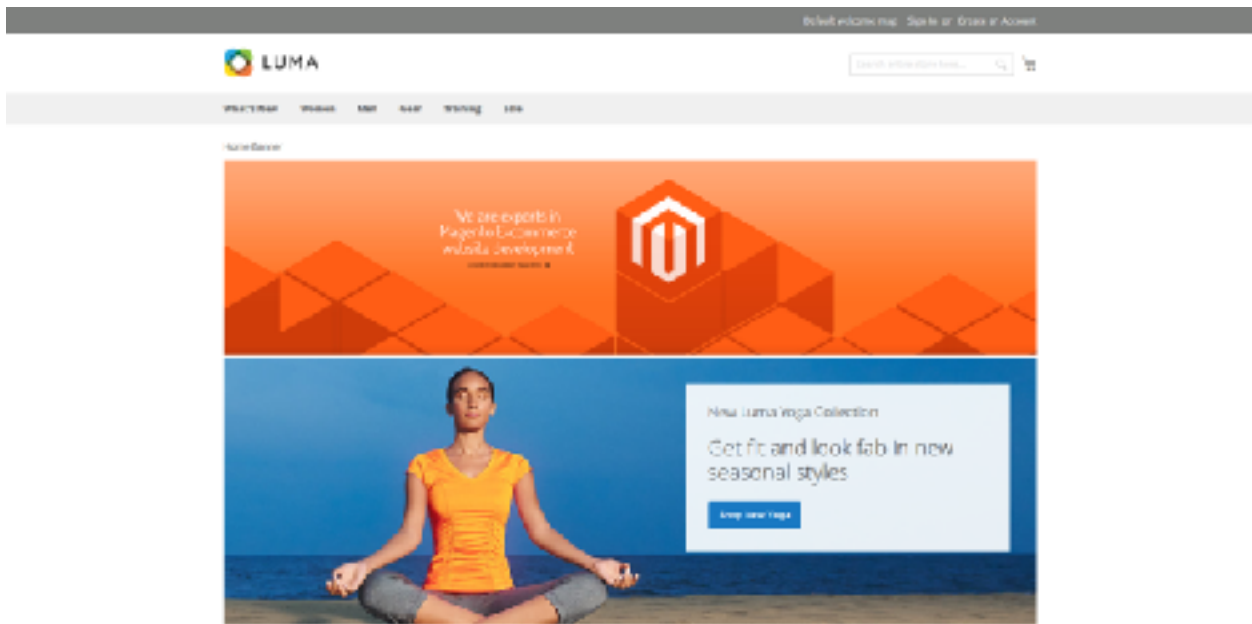

Added Home Banner Image which has id 3 so you can add below code in the home page block

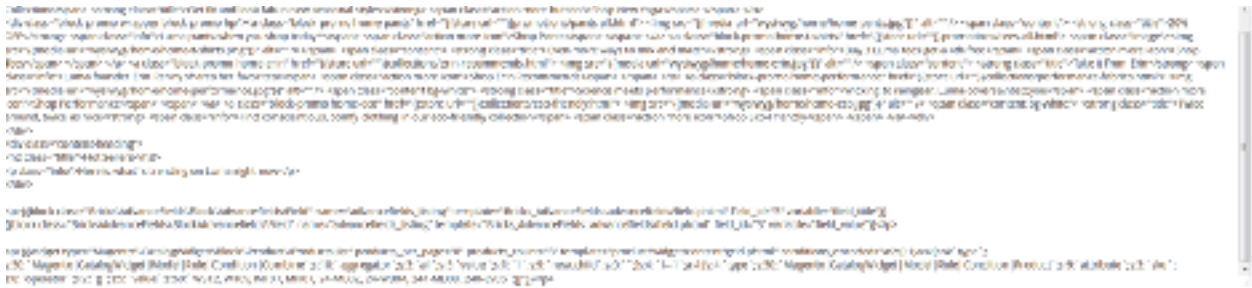

```
{{block class="Bricks\AdvanceFields\Block\Advancefields\Field"
name="advancefields_listing" template="Bricks_AdvanceFields::advancefields/field.phtml" field_id="3" variable="field_title"}}
```

```
{{block class="Bricks\AdvanceFields\Block\Advancefields\Field"
name="advancefields_listing" template="Bricks_AdvanceFields::advancefields/field.phtml" field_id="3" variable="field_value"}}
```

The image banner will be displayed.

You can also move the position of the block code as per your need on the page like we have moved the block code in the Hot Sellers Section.

After adding the above code the custom image banner will be shown in the Hot Sellers

There is one other way by which you can show field title and field value for particular record. To achieve this you have to add. This block will help us to print both fields parameters in just one call.

```
{{block class="Bricks\AdvanceFields\Block\Advancefields\Row"
name="advancefields_row" template="Bricks_AdvanceFields::advancefields/row.phtml"
field_id="1"}}
```

It will show the field title and field value in the list format.

[About Us](#)

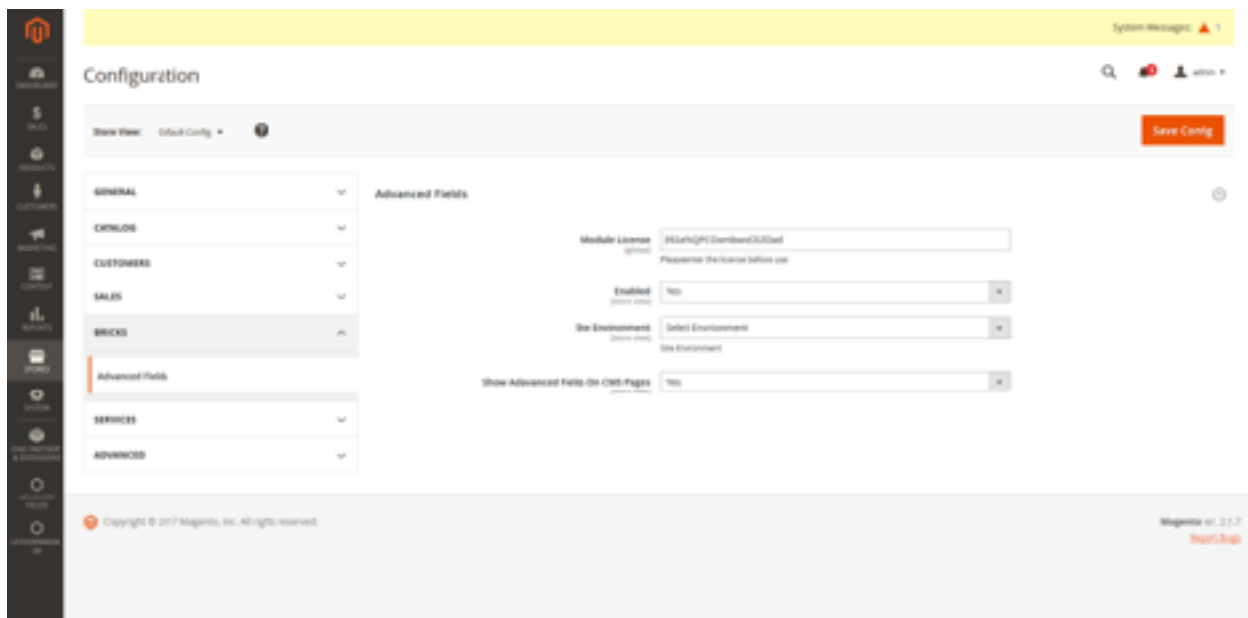

To Show all the customer fields of the particular page then you have to call the below block code in the page

```
{{block class="Bricks\AdvanceFields\Block\Advancefields\Listing"
name="advancefields_listing" template="Bricks_AdvanceFields::advancefields/
listing.phtml"}}
```

It will list out all the fields of that particular page in the list format.

If you like to enable listing fields by default on all the pages. Then you have to set the Show Advanced Fields On CMS Pages to Yes. After setting it to Yes all the custom fields will be listing on the corresponding pages.

Make sure cache flushed after making changes in the backend.

Below is the summary of all the block code available in the Bricks Advanced Field Extension.

2. To Show Particular Field Title of the row

```
{{block class="Bricks\AdvanceFields\Block\Advancefields\Field"
name="advancefields_listing" template="Bricks_AdvanceFields::advancefields/
field.phtml" field_id="1" variable="field_title"}}
```

To Show Particular Field value of the row

```
{{block class="Bricks\AdvanceFields\Block\Advancefields\Field"
name="advancefields_listing" template="Bricks_AdvanceFields::advancefields/
field.phtml" field_id="2" variable="field_value"}}
```

To Show list of all the fields available for that particular page

```
{{block class="Bricks\AdvanceFields\Block\Advancefields\Listing"
name="advancefields_listing" template="Bricks_AdvanceFields::advancefields/
listing.phtml"}}
```

To Show title and value of particular row in one call

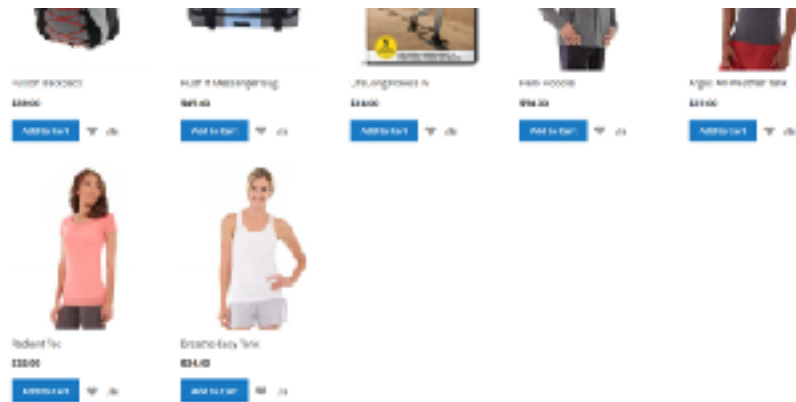

```
{{block class="Bricks\AdvanceFields\Block\Advancefields\Row"
name="advancefields_row" template="Bricks_AdvanceFields::advancefields/row.phtml"
field_id="2"}}
```

3. Direct Adding code in PHTML File

In case you can want to use the block code directly in the phtml template then you can use below code to show the custom field:

```
<?php echo $this->getLayout()-
>createBlock("Bricks\AdvanceFields\Block\Advancefields\Field")-
>getAdvanceFieldsValue(1,'field_title'); ?>
```

Above code will show Field title of 1 record. For Example I have added the custom block code in the newsletter subscribe.phtml and title of the first record showing as below.

To show the value of the field

```

<?php echo $this->getLayout()-
>createBlock("Bricks\AdvanceFields\Block\Advancefields\Field")-
>getAdvanceFieldsValue(1,'field_value');  ?>

```
