

## NetSuite Connector User Guide

Take a backup of your site before installing the module. It is advised to set the mode of the instance into development before installing the module. Open console and navigate to <magento root folder> run the following command.

1. `php bin/magento deploy:mode:set developer` then `goto <magento root folder>/app/code` folder. (If you don't see code folder create one and then create a Celigo folder and extract the extension files into this folder. If files already in Celigo folder and then remove existing and extract new files.)
2. Then go to open up console navigate to <magento root folder> run the command: `php bin/magento setup:upgrade`

Note: If you installing the module in developer mode then you don't need to re-compile otherwise you will need to recompile and generate the static-content for browser using the following command

1. `php bin/magento setup:di:compile`
2. `php bin/magento setup:static-content:deploy`

Revert back the mode to production after above things setup.

`magento deploy:mode:set production` & make sure all file and folder permission are proper.
