

## VAT Validation With Country Codes

for Magento 2

This document describes how to use the CopeX\_VATFix plugin.

**For Installation please see the “Installation Instructions for M2”**

### Short Description

This is a Magento 2 module to enable VAT ID validation with country codes (ex. ATU69932326) as usual in EU.

### Explanation

Magento2 can change a customers group regarding to a valid VAT ID. This feature is especially useful for companies within the EU.

There is a small issue in Magento2 (also Magento1) thus it is not possible to correctly validate a VAT ID where the country code is in it.

In Europe the VAT consists of 2 letters that represent the country and additional letters for the company identification.

This plugin changes the behaviour how Magento validates the VAT ID so a full VAT ID can be entered.

With this plugin it is possible to validate a VAT ID even for countries like Greece (ISO: GR, VAT: EL) or the United Kingdom (ISO: GB, VAT: UK) where the declarations collide.

With this extension installed it enables Magento2 to accept VAT IDs (UID) with prepended countrycodes (ex. **ATU69932326**) for all european countries. For all other countries the check stays the same. We use the original VIES Service to validate the given VAT ID / UID.

The image shows a portion of a Magento2 checkout form. It includes the following fields and elements:

- ZIP/Postal Code** [website]: An empty text input field.
- City** [website]: An empty text input field.
- Street Address** [website]: An empty text input field.
- Street Address Line 2** [website]: An empty text input field.
- VAT Number** [website]: A text input field containing the value "ATU69932326".
- Below the VAT Number field, the text "VAT Number is valid." is displayed.
- A button labeled "Validate VAT Number" is positioned below the validation message.

## Workflow

When a customer saves a vat number:

1. the plugin takes the given string
2. validates the country code if it is a valid EU country code defined in ISO-3166-Alpha-2-Code
3. if it is valid, it changes the parameter for original method of magento.
4. magento sends the validation-request to the VIES-Service and the normal workflow of magento is executed

## Information

This extension is a plugin, it will work out of the box when it is installed correctly. There are no settings in the backend.
