

Dual prices display

The module adds a second price for dual price display during the currency transition period on the following parts of the Magento instance:

- Product listing pages
- Product display page (works on all product types as well as for products with custom options)
- Mini cart block
- Cart and checkout pages
- My account pages
- Order related emails

Functionality is implemented based on the [official proposal](#).

Module is intended to be used with EUR and HRK currencies. Other currencies are not supported.

Configuration

There is no on/off switch, once installed module will display prices in both currencies.

Primary/side currency selector

To choose which one is the main currency and which should be displayed as a side currency, go to:

Stores > Configuration > General > Currency > Dual Prices Display > Side Currency

The default side currency is EUR.

Separator configuration

The module allows you to define the separator that will be used on the frontend.

Stores > Configuration > General > Currency > Dual Prices Display > Separator

Input there defines a character between main and side currency. For example, 1EUR / 7,53450HRK. If left empty, the main and side currency will be separated by a single space.

In addition to separator configuration, the separator is wrapped in `span.side-price-separator` so that it can be further styled on the frontend.
