YOUR GLOBAL ECOMMERCE PARTNER

# SALES PAGE USER GUIDE

Thank you for choosing our extension for the Magento store. Our module collects all discounted products within a single category, so you do not need to do it manually and update it every time you add new promotions or cancel old ones.

**Version: 2.0.0**

→ **CONTENTS**

- Requirements
- Installation
- Activation
- Configuration
- Deleting Sales Page Extension
- Verification
- Troubleshooting

## REQUIREMENTS

[Magento 2 requirements](#)

## INSTALLATION

1. Install the module via Composer. Run the next command:

```
composer require magecom/module-sales-page
```

Before running the next commands, make sure that Magento doesn't have the sales category with the name 'Sales' and the URL-key 'discount-sales-page.'

2. Enable Magento Module:

```
php bin/magento module:enable Magecom_SalesPage  
php bin/magento setup:upgrade
```

3. If Magento 2 works in the production mode, run this command:

```
php bin/magento setup:static-content:deploy
```

## ACTIVATION

1. Go to **Stores + Settings + Configuration + Magecom Extension + Sales Page**. Set the value of 'Is Enabled?' to **Yes**.

2. Run reindex (you can skip this step if cron is running for your store):

```
php bin/magento indexer:reindex magecom_sp_discount_products
```

Now you should see the Sales Page category on your storefront. This should be the category with title 'Sales' and URL-key 'discount-sales-page.'

## CONFIGURATION

All configurations can be found in **Stores + Settings + Configuration + Magecom Extensions + Sales Page.**

Name	Description
Is Enabled?	Turn on/off the module
Allowed prices	Enabled or disabled different price types (see the description below)
Invalidate Sales Indexer	Set sales category indexer as invalid to run reindex with the next scheduled cron job

### Discount Types

**Special Price** – a special price can be offered for a designated period of time. During the specified time period, the special price appears instead of the regular price, followed by a notation that shows the regular price. To find more details, follow the [link](#).

**Catalog Price Rules** – catalog price rules can be used to offer products to buyers at a discounted price, based on a set of defined conditions. Catalog price rules do not apply coupon codes because they are triggered before a product is placed into the shopping cart. To find more details, follow the [link](#).

The module currently ignores customer group configuration for catalog price rules. So if you have different price rules for different customer groups, all affected products will be assigned to the sales category and will be shown to all customer groups.

## DELETING SALES PAGE EXTENSION

1. Run the commands:

```
php bin/magento module:disable Magecom_SalesPage
php bin/magento setup:di:compile
```

2. If Magento 2 works in the production mode, you need to run the command:

```
php bin/magento setup:static-content:deploy
```

3. Remove module from composer.json file:

```
composer remove magecom/module-sales-page
```

4. Clean up the database by running next SQL commands:

```
DELETE FROM catalog_category_entity WHERE entity_id IN
(SELECT `value` FROM core_config_data WHERE path =
'magecom_sales_page/general/sales_category_id');
```

```
DELETE FROM url_rewrite WHERE entity_id IN (SELECT `value`
FROM core_config_data WHERE path =
'magecom_sales_page/general/sales_category_id') AND
entity_type = 'category';
```

```
DELETE FROM core_config_data WHERE path LIKE
'magecom_sales_page/%';
```

5. Run the commands:

```
php bin/magento indexer:reindex
php bin/magento cache:clean
```

## VERIFICATION

How to make sure that the installation is completed successfully and how to find the sales category once the installation is completed?

1. In the admin panel go to **Stores + Configuration + Magecom Extensions + Sales Page**.

You should see module configurations.

The screenshot shows the Magento 2 Configuration interface. On the left is a vertical sidebar with navigation icons for Dashboard, Sales, Catalog, Customers, Marketing, Content, Reports, Stores, System, and Find Partners & Extensions. The main content area is titled "Configuration" and shows the "Sales Page" module configuration under the "MAGECOM EXTENSIONS" category. The "General" tab is active, displaying the following settings:

- Scope:** Default Config
- Save Config:** Button
- GENERAL:** General
- Is Enabled? [website]:** Yes
- Allowed Prices [website]:** Special Price, Catalog Price Rules
- Use system value:**
- Invalidate Sales Indexer:** Button

2. After enabling the module a new category Sales will appear on the categories tab in the admin panel.

3. On the frontend page, you should see a new category Sales:

4. After adding the special prices for a product, this product should be visible on the Sales page:

5. After adding the catalog price rules prices for a product, the products that fall under this rule will appear on the Sales page:

Please, pay attention! All changes will be applied after reindexing. Check your Index Management settings (**System + Index Management**) for Discount Products indexer. If you have mode 'Update By Schedule', all changes will be applied by cron in a couple minutes. Make sure your cron is set up properly ([How to configure and run cron in Magento DevDocs](#)). If you have Discount Product indexer configured to work in 'Update On Save' mode, all changes will be applied after saving products or Catalog Price Rule.

## ◆ TROUBLESHOOTING

In case something went wrong after installation, please try the steps below:

1. Ensure that the sales category has been created. You can check it in the admin dashboard (this should be the first level category with the name 'Sales' and URL-key 'discount-sales-page', or by running SQL query:

```
SELECT c.entity_id
FROM catalog_category_entity c
      INNER JOIN catalog_category_entity_varchar AS u ON
c.entity_id = u.entity_id
      AND u.attribute_id =
      (SELECT attribute_id FROM eav_attribute WHERE
attribute_code = 'url_key' AND entity_type_id = 3)
WHERE u.value='discount-sales-page';
```

If you get an empty set, then something went wrong during activating the module.

Try to deactivate and activate the module again from the admin dashboard.

If this doesn't help, then you can try to create the sales category (actually, this is a regular Magento category) manually from the admin dashboard.

2. Ensure that this category is specified in the configuration as the sales category.

You can check this by running the next command:

```
SELECT value FROM core_config_data WHERE path =  
'magecom_sales_page/general/sales_category_id';
```

If you get an empty set or the value does not match the entity\_id, which you get on the previous step, update the configuration by running next sql command:

```
INSERT INTO core_config_data(scope, scope_id, path, value)  
VALUES ('default', 0,  
'magecom_sales_page/general/sales_category_id',  
'<category_id>')  
ON DUPLICATE KEY UPDATE value=VALUES(value);
```

3. Now go to the module configuration page, click the 'Invalidate Indexer' button. At this point the module should work as per the user manual.

4. In case you still don't see your category on the storefront, please ensure that you don't use any mega menu modules, which would require additional actions to make the category visible in the menu.

If you do, then you will probably need to do some additional actions with the category configuration. e.g. check the option 'Visible on Frontend' or 'Include into Top Menu'.

Please refer to the mega menu module manually to get the exact list of actions.
