Key Features

PCI SAQ-A eligibility: Stripe Elements collects all credit card data for you

PCI is an information security standard for organizations that handle branded credit cards. Stripe has the highest rate of PCI certification. Stripe gets PCI compliance for your payments by implementing Stripe's client-side tokenization in Stripe Elements.

Vault Option

Allows customers to save credit card details to use them for future purchases. When a customer makes his/her order on the checkout page and fills up the credit card data, he/she can choose to store the data for later use. Completing the next order will allow the customer to use already saved credit card data not typing it one more time.

Authorize or Authorize and Capture

There are two behaviors for payments processing and one must be set according to business processes.

Authorize helps you only to authorize an order amount and manually capture it by creating invoice when it's required. An authorization locks the order amount in the customer's bank account until the merchant captures it. For example, the transaction can be captured when you ship the products to the customer.

Authorize and Capture action tells Stripe to capture a transaction at the time of creating order. The transaction will transfer the order amount from the customer's bank account.

Void/cancel authorizations

When a payment was authorized and not captured yet, merchants can perform cancellation of the transaction from admin panel so the transaction will be released.

Expired authorizations

Stripe supports two-step card payments so you can first authorize a charge, then wait to settle (capture) it later. When a charge is authorized, the funds are guaranteed by the card issuer and the amount held on the customer's card for up to seven days. If the charge is not captured within seven days, the authorization is canceled and funds released. With the extension, you can charge for invoice total amount as a new transaction. It works only for customers who have stored credit card and have requested funds on their bank account.

Partially invoice orders

Partial invoicing is possible only if Authorize payment processing is used. Administrator adds a few products from an order to an invoice. Total amount of the invoice is captured from order transaction. Since only one capture is possible for a transaction, the rest of order amount will be released. Next invoices for the same order are possible with usage a stored credit card.

Country Specific Credit Card Types

An admin can specify in the configuration panel specific credit card types for specific countries. For example, you can specify to allow only American Express for the United States.

Multiple currencies support

Stripe has a great feature to receive payments in multiple currencies. Stripe accumulates separate balances for each currency. If possible, Stripe automatically sends payouts to an associated bank account (or debit card) for each currency, thereby avoiding exchange fees. Stripe Payments extension allows you to choose whether you want to process payments in base currency or actual order currency.

Partially Refund Orders

This option is very helpful when a customer completed an order and you don't have all products in stock so you have to refund part of a payment. Also, it's required returns management.

Secure Iframe Payment

Security plays a significant role in recent days so using Mageside's Stripe Payments extension will protect you from credit card hacks. All credit card data is sent directly from your customers to Stripe. Our extension implements Stripe Elements for all credit card details fields and so as none of the data comes to the server, it cannot be compromised.

Configuration

- **Enable this Solution** – To enable „Stripe Payments“ select “yes”.
- **Title** – Type the title which will be seen on store view.
- **Payment Action** – Select the type of payment action. Stripe supports two-step card payments so you can first authorize a charge, then wait to settle (capture) it later. When a charge is authorized, the funds are guaranteed by the card issuer and the amount held on the customer’s card for up to seven days. If the charge is not captured within this time, the authorization is canceled and funds released. **Authorize** helps you only to authorize an order amount and manually capture it by creating invoice when it’s required. An authorization locks the order amount in the customer’s bank account until the merchant captures it. For example, the transaction can be captured when you ship the products to the customer. **Authorize and Capture** action tells Stripe to capture a transaction at the time of creating order. The transaction will transfer the order amount from the customer’s bank account.

- **Expired Authorizations** – This option allows creating a new charge after expired days (usually it's seven days). The sum can be charged only if it's available on the payment card. Or an error message can be shown to admin and the payment card won't be captured.
- **Test Mode** – To enable test mode select "yes".
- **Publishable Key** – Type the publishable key which you got while creating Stripe account.
- **Secret Key** – Type the secret key

Expired Authorizations [website]	<div>If a customer has a stored card, try to create a new charge</div> <div>Uncaptured authorizations will expire in seven days. What should we do when there is an attempt to capture such authorization?</div>
Test Mode [website]	Yes
Publishable Key [website]
Secret Key [website]

- **Accepted Currency** – Select a type of accepted currency: base or store currency. **Base currency** is Stripe currency. **Store currency** is the currency that is used by the store.
- **New Order Status** – Select what type of order status should have a new order.
- **Vault Enabled** – Enable the vault if you want to let your customers to save payment cards information on Stripe servers. The customer can use saved cards for future purchases.
- **CVV Verification** – To enable CVV verification select “yes”.
- **Credit Card Types** – Select what credit card types are available in the extension.

Invoice Processing

Expired Authorizations

Stripe supports two-step card payments so you can first authorize a charge, then wait to settle (capture) it later. When a charge is authorized, the funds are guaranteed by the card issuer and the amount held on the customer's card for up to seven days. If the charge is not captured within seven days, the authorization is canceled and funds released. With the extension, you can charge for invoice total amount as a new transaction. It works only for customers who have stored credit card and have requested funds on their bank account.

Authorization expired:

The screenshot displays a Stripe payment interface. At the top, the amount is \$88.35 USD, with a 'RELEASED' status. Below this is a '+ Add note' button. A list of events follows: 'Authorization expired' (Mar 4, 2:39 PM) is highlighted with a red box; 'Payment authorized' (Feb 25, 2:39 PM) is marked with a checkmark; and 'Stripe risk evaluation: normal' (Feb 25, 2:39 PM) is marked with a shield icon. A 'Payment details' section is shown below, containing a table of transaction information. The 'ID' field, 'ch_1Bz0n3KxTBzZIz6DMiu0hMio', is highlighted with a red box. Other details include Amount (\$88.35), Refunded (\$88.35), Fee (\$0.00), Date (2018/02/25 14:39:41), Status (Refunded), and Description (000000050).

Stripe Payments by Mateside

Partially Refund

This option is very helpful when a customer completed an order and you don't have all products in stock so you have to refund part of a payment.

To refund the order partially go to **Orders > Select a necessary order > Invoices > Select the Invoice > Credit Memo > Select what products to refund > click "Refund"**

In this example, we will refund 1 item per each product:

Items to Refund

Product	Price	Qty	Return to Stock	Qty to Refund	Subtotal	Tax Amount	Discount Amount	Row Total
Olivia 1/4 Zip Light Jacket SKU: WJ12-S-Blue Color: Blue Size: S	\$77.00	Ordered 2 Invoiced 2	<input type="checkbox"/>	<input type="text" value="1"/>	\$77.00	\$0.00	\$15.40	\$61.60

Mageside is a team of developers dedicated to Magento installation, support, extension creation and advanced customization. We are good at doing the heavy lifting, and there is no Magento project that is out of scope on a technical basis.

Mageside does full site conversions, Magento 2 upgrades, advanced extension development, deep systems integration and all the other fun stuff. Our code is incredibly clean, we are on first name basis with several of the core devs, and love every opportunity to create another fine expression of ecommerce. If you need the best, let us work on your next project.
