

How It Works:

1. Suppose, the customer interested to buy a T-Shirt from your store, where it's actual price is \$100 & but, customer want to purchase that T-shirt on \$90. In such situation, customer can use the bargaining service from your store by just clicking on the "Suggest Your Price" button on the "Product Listing" as well as on the "Product View Page".
2. Customer can bargain on that product by sending the new best price request to the admin that is lower than the actual price.
3. After receiving the request, the admin can accept, reject or suggest the new price to the customer & send the status notification to the customer(approved/Rejected/Suggested new price).
4. The customer can easily check their request status on the "User Dashboard" under "oCodewire Price Bargain" tab.
5. If admin send the last/final bargain price to the customer, then customer can see that under the "Owner Price" on their dashboard. Customer can select an action according their choices.
6. By clicking on "YES" Action, an "Approved Status" will be send to the admin. As well, admin can approve that final price and send a coupon to the customer.
7. If customer clicks on "NO" Action, then a "Rejected Status" will be send to the admin.
