To – is a comma separated list of emails, which will get emails with error reports,
 From – is an email address of the sender,
 Subject – is a subject title for the emails,
 Level – is the main setting there. It's minimal log level that will be saved into DB. "DEBUG" and "INFO" levels aren't recommended to use. In developer mode on every page loading Magento

generates a lot of debug information for each layout/cache keys. It's recommended to set higher level immediately after installation to avoid unnecessary logs in the first email.
Send – "No" stands for saving logs into DB but not sending them to provided emails.
Cron – is schedule for generating report emails. If "send" was set "no", no email will be generated.

Shell commands

bin/magento logmailer:flush – flush all saved logs. Recommended to do that after applying appropriate settings.

bin/magento logmailer:send – generate a report and send it to provided in settings emails.

NOTE:

An email contains all errors not sent earlier. The next email will have all errors saved into db since sending previous email until generating the report. To flush unnecessary log messages, run "flush" command.
