

Postcode.nl Address Validation

Setup

1. Install the extension

Install the Postcode.nl Address Validation extension for Magento using the Magento backend. A new section 'Postcode.nl API' will appear in the backend menu after installation. If it does not, or if you see a 404 not found page, please logout of the backend and login again.

2. Register a Postcode.nl account

The extension requires a separate account for our paid service. Please register your account starting at <https://services.postcode.nl/adresdata/api>. As soon as you've completed the first few steps of the registration, you'll automatically receive an email with the credentials ('key' and 'secret') for our service.

3. Extension configuration

In the Magento backend, go to the 'Postcode.nl API' section and enter these credentials. The configuration screen will test the credentials and connection and provide instant feedback.

Usage

At checkout, if the customer chooses 'the Netherlands' as country for their address, the extension will make the street and city name read only and only ask the customer for his or her postcode and house number.

The following screenshot shows this part of the checkout form. Here, the customer has entered the postcode '2012ES' and house number '30', and the extension has already verified the combination and added the street and city name ('Julianastraat' and 'HAARLEM' respectively).

Note, although this screenshot is Dutch, the extension supports both English and Dutch languages.

Land *

Nederland

Postcode *

2012ES

Huisnummer *
