

Currency rate updater Module User Guide

Prerequisites

Before installing the Currency rate updater module you should setup a test environment as you will need to put Custom currency rate in front which will certainly take a while for configuring and testing. If you directly roll out this solution to your production server you might experience issues that could affect your normal business.

Ensure that your Magento2 store is running without any problems in your environment as debugging Magento2 issues with

Ensure that your Magento2 store cron job is running.

If you need professional services for assistance with setting up your environment please contact er.sanjaygohil@gmail.com

Troubleshooting

Ensure that the caches are cleaned and disable / re-enable the module. Ensure that Cron is running to get the latest currency rate.

If any critical issue occurs you can't easily solve, execute `php bin/magento module:disable Sanjay_CustomCurrencyUpdater` as the Magento Filesystem Owner to disable the Sanjay_CustomCurrencyUpdater module and clear Magento's cache again. If possible, gather as many data and open an issue to help improve the module.
