

# Settings

Breeze lets you configure some options.

1. Login to Magento backend and open *Content > Design > Configuration* page.
2. Select the Store you want to change and press *Edit*.
3. Scroll down to the *Breeze* fieldset.

▼ View Screenshot

**Enable Breeze Experience**

Breeze module will replace all scripts with its own simplified version. It will also remove all custom and third-party modules scripts.

**Disable Breeze for specified URLs**

One url per line. Example: /helpdesk or ?param=1

**Enable Turbo Feature**

This feature adds a turbo.js library that provides a speed of a single-page web application for your store.

**Enable Responsive Images**

This feature allows to serve most suitable image size per device. Theme developer must describe srcset property in view.xml file in order to enable this feature.

**Debug Mode**

Allows to force breeze status via query parameter: ?breeze=1 or ?breeze=0

Here is a list of available options:

Option	Description
--------	-------------

Option	Description
Enable Breeze Experience	Allows to disable Breeze Module. Useful when using Breeze Module for Luma or other third-party non-breeze theme.
Disable Breeze for specified URLs	Ability to specify URLs where Breeze Module should be disabled. Useful for third-party module pages that use custom uiComponents (knowledgebase, helpdesk, etc).
Enable Turbo Feature	Allows to enable single-page application experience.
Enable Responsive Images	Serve most suitable image size per device. Theme developer must describe srcset property in theme's view.xml file in order to enable this feature.
Debug Mode	When enabled, allows to force Breeze Module status via query parameter: <code>?breeze=1</code> or <code>?breeze=0</code>

Some options use `Use Theme Config` value as default. This means that the value will be taken from view.xml file of the active theme if found. It's very useful for Breeze-based themes, as they can activate Breeze module and other options automatically.
