1. Introduction

This extension that comes out of Woom labs makes it easier for merchants to manage CMS pages in a form of tree, wherein one CMS page can have multiple child pages, and so on. It also provides the ability for merchants to provide links to their CMS pages in top navigation menu that usually displays only categories. It also provides flexibility in terms to the position of the CMS page link - a merchant can pick a position relative to a category already being displayed in top navigation menu.

2. Installation

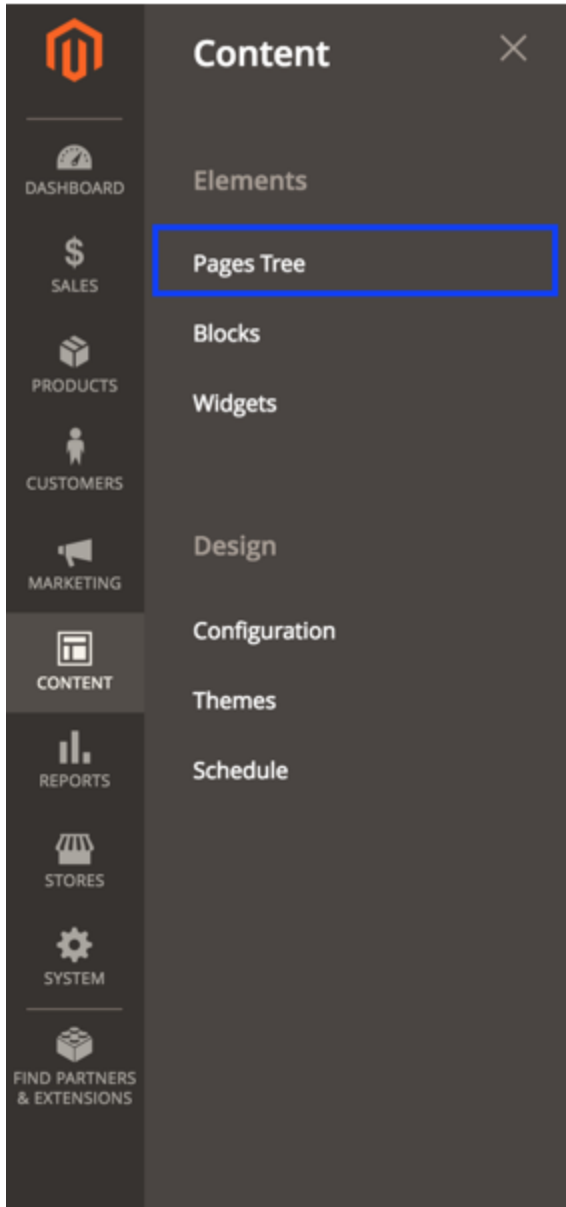

This extension can be installed via:

1. Copying extension contents into app/code folder of your Magento 2 installation
2. Component manager
<http://devdocs.magento.com/guides/v2.1/comp-mgr/module-man/compman-start.html>

3. CMS page management overview

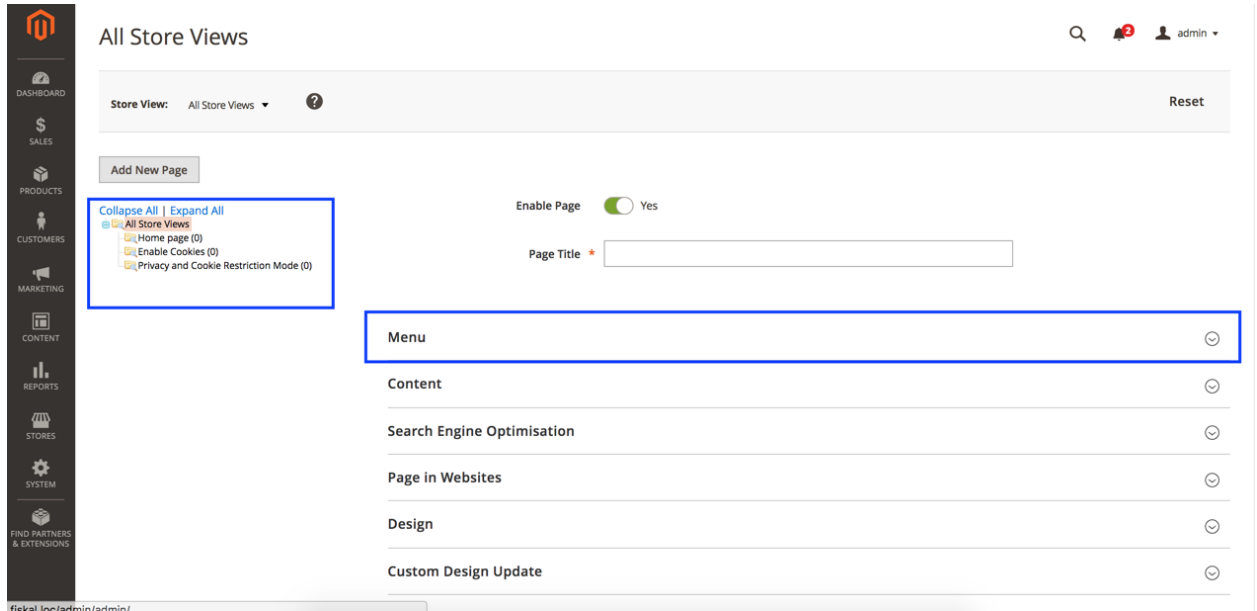

To add a manage CMS pages, follow these steps:

1. Open your Magento 2 administration and navigate to “Content->Pages Tree” section

2. You will immediately enter “Edit page” mode where you can see all of the sections you have previously had in CMS pages management, with two added sections - “Cms Tree

view” block and “Menu” section.

3. “Root” CMS pages cannot be saved - these are here for tree appearance only. Let’s choose a “Home page” CMS page by clicking on “Home page” text inside a tree view.

4. Managing tree structure of CMS pages

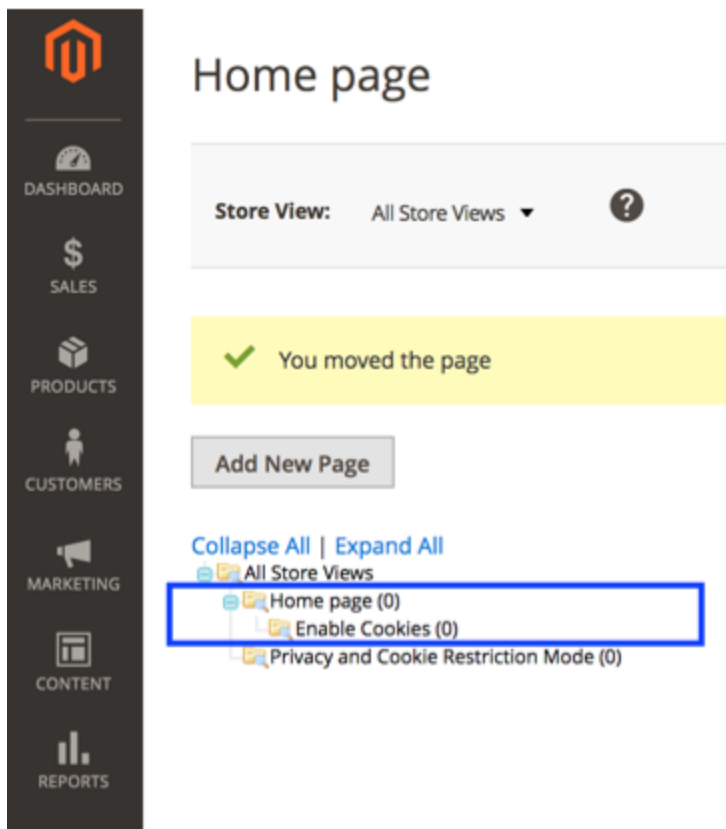

If you have followed the steps from previous section, you have “Home page” open, with two sections - “Cms Tree view” block and “Menu” section. Let’s go over “Cms Tree view” block.

What this extension enabled you to do is to place one CMS page as “child page” of another CMS page. We can exercise this by dragging and dropping “Enable Cookies” page on top of “Home Page”.

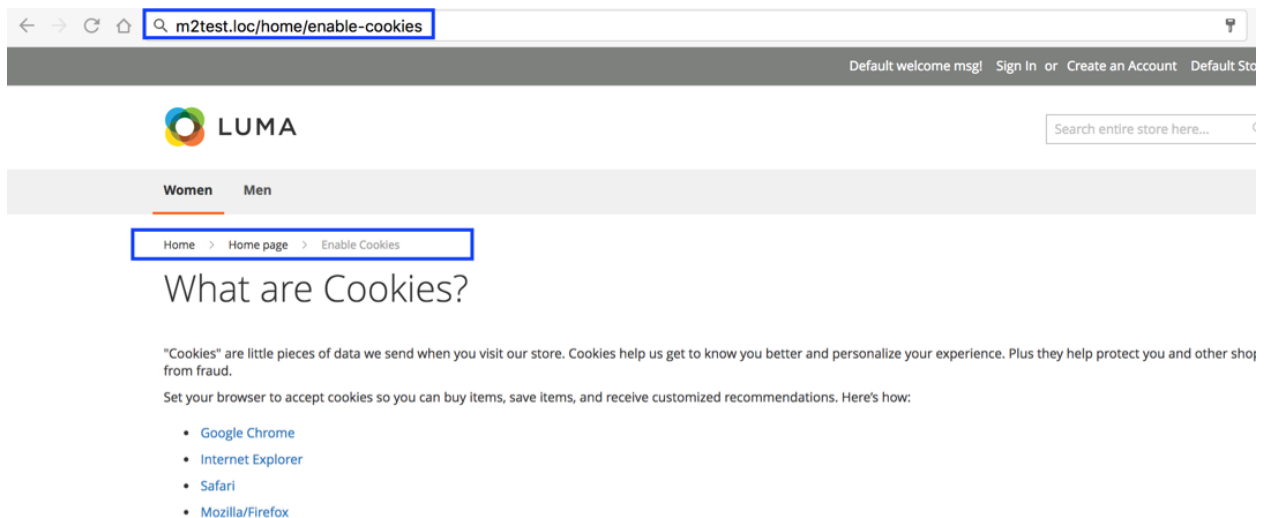

1. Click and drag “Enable Cookies” page on top of “Home Page”.

2. After the release the click of our mouse button, “Enable Cookies” page is now placed as a child page of “Home Page”

3. That page is now also accessible via frontend, on the link <https://your-store/home/enable-cookies>

4. This is also reflected inside breadcrumbs block on frontend

Note that you can add new pages to the structure or move pages in or out of a parent page, the same as you would usually move categories inside Magento2 admin.

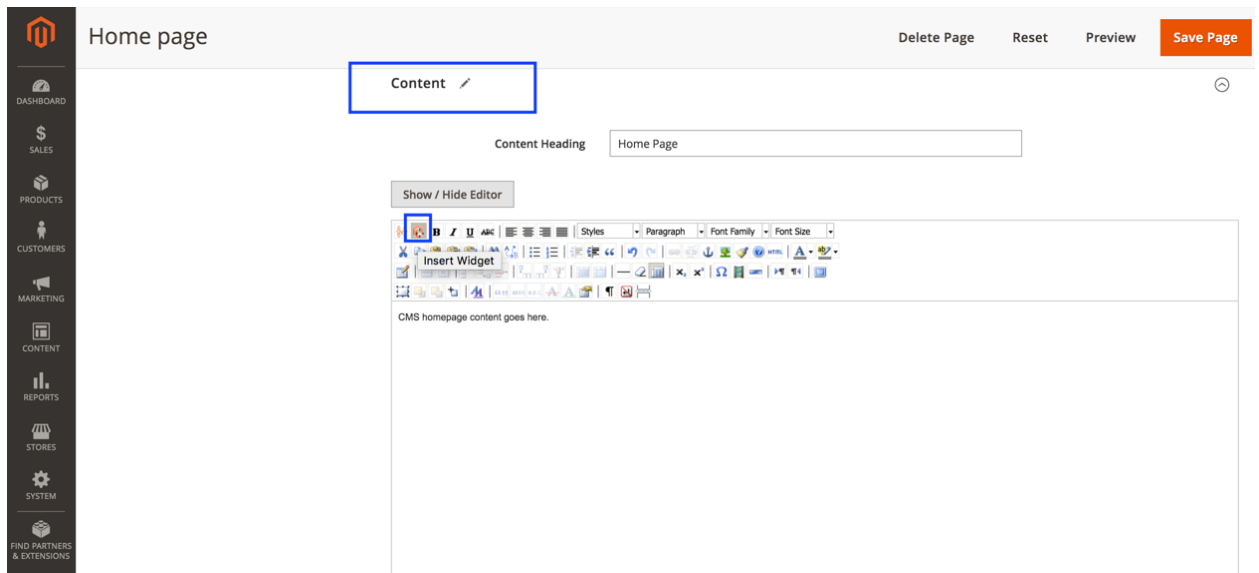

To be able to make use of the new page structure, there are two parts that make this extension more usable for merchants:

- Display child pages on a parent page via widget
- Add CMS page(s) and their children to top navigation menu

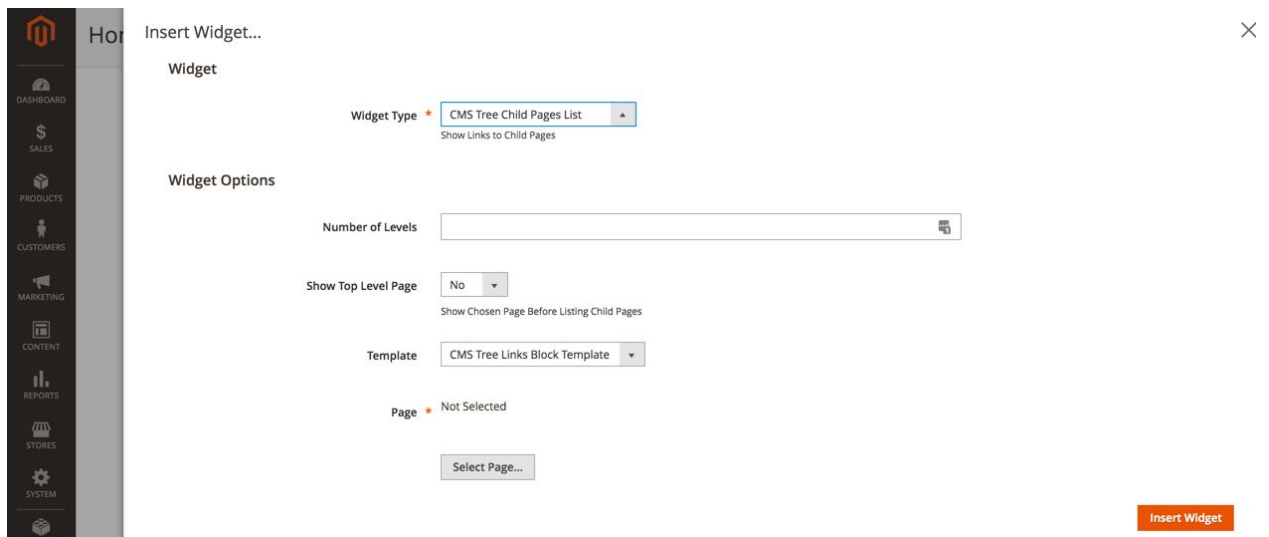

5. Displaying child pages on a parent page

To display a list of child pages on a parent CMS page (or any other place where widgets work on Magento 2 system), follow the following steps:

1. Open “Home page” page, or any other page
2. Open “Content” section and click on “Insert widget” button

3. A screen will open where you can select “Cms Tree Child Pages List” widget and display child pages of any page that has child pages.

- Let's click "Select Page..." button and click on our "Home Page" page, as it has children pages assigned.

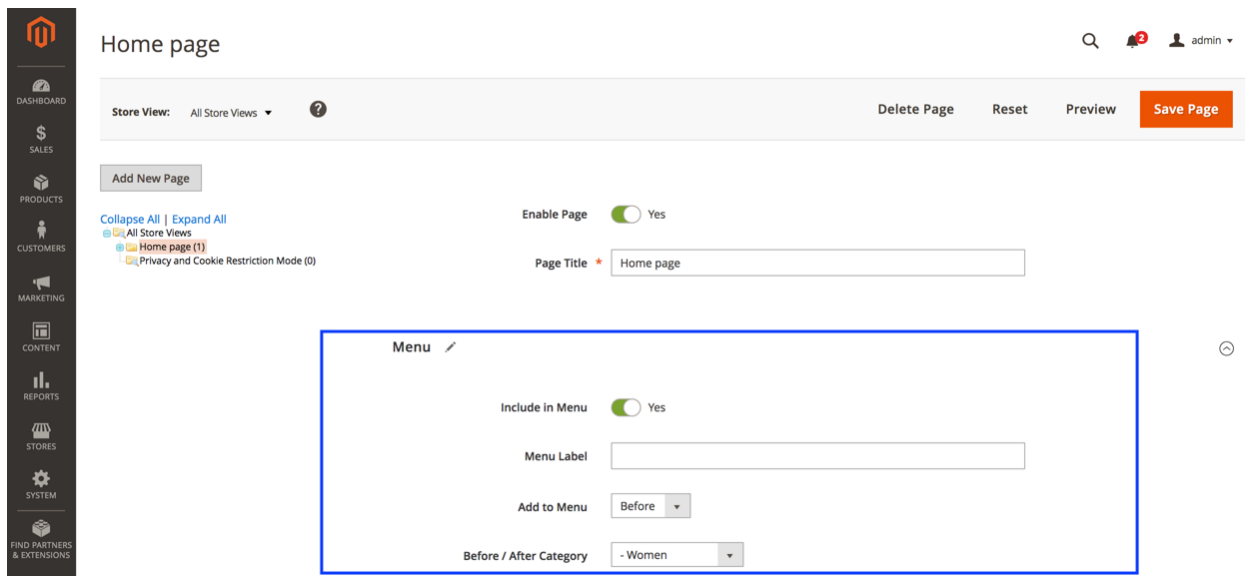

- Click "Insert Widget" and "Save Page" buttons.
- On store frontend, we now have our child page displayed, in structured form

6. Add CMS page(s) and their children to top navigation menu

To display parent and child CMS pages in top menu, follow the next steps:

1. Open “Home page” in CMS page management we have used in our example so far
2. Expand “Menu” section

The screenshot shows the CMS page management interface for the 'Home page'. On the left is a vertical sidebar with navigation icons for Dashboard, Sales, Products, Customers, Marketing, Content, Reports, Stores, System, and Find Partners & Extensions. The main content area is titled 'Home page' and includes a search icon, a notification bell with '2', and a user profile 'admin'. Below the title, there's a 'Store View' dropdown set to 'All Store Views' and buttons for 'Delete Page', 'Reset', 'Preview', and 'Save Page'. An 'Add New Page' button is also present. The 'Enable Page' toggle is turned 'Yes'. The 'Page Title' field contains 'Home page'. A blue-bordered box highlights the 'Menu' configuration section, which includes: 'Include in Menu' toggle (turned 'Yes'), 'Menu Label' text input, 'Add to Menu' dropdown (set to 'Before'), and 'Before / After Category' dropdown (set to '- Women').

3. Enable “Include in Menu” option, as shown above. You can also select where his menu item will be shown in your top navigation menu, according to categories already displayed in menu.

The screenshot shows the LUMA storefront. At the top right, there's a navigation bar with 'Default welcome msg!', 'Sign In or Create an Account', and 'Def...'. Below this is the LUMA logo and a search bar with the placeholder 'Search entire store here...'. The top navigation menu is highlighted with a blue box and contains 'Home page', 'Women', and 'Men'. Below the menu, the page title is 'Home Page' and the content area says 'CMS homepage content goes here.' with a link to 'Enable Cookies'.

4. If this page has child pages that also have a “Include in menu” set to “Yes”, these child pages will display in menu as well.

7. Add to menu options

This extension also provides you with an ability to add pages to top navigation menu, where you could usually display only categories. There are multiple options you can select.

1. Include in menu
 - Adds the CMS page to top menu
2. Menu label
 - Sets a label for menu item. You can choose to have a menu link title to be different than your CMS page title. This option falls back to CMS page title, if the option is left blank
3. Add to menu
 - Add CMS page link before or after certain category. You can choose between two options:
 - Before
 - Adds CMS page before selected category
 - After
 - Adds CMS page after selected category
4. Before/After category
 - Select a category to which you would like to tie your CMS page to.

8. Widget options

Insert Widget...

Widget

Widget Type * 
Show Links to Child Pages

Widget Options

Number of Levels

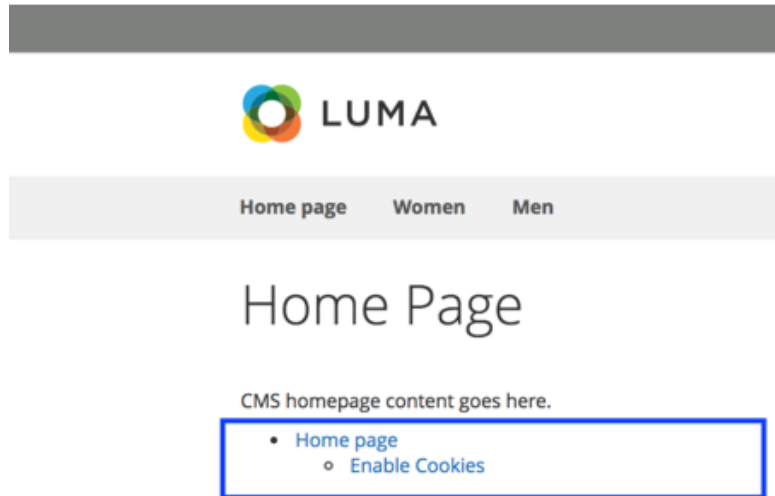

Show Top Level Page 
Show Chosen Page Before Listing Child Pages

Template 

Page * Home page

1. Number of Levels
 - Enables you to select how many levels of depth you want to display via widget.
 - If empty, the widget will display all child pages, i.e entire page structure, starting from parent page.
 - If this field is set to “0”, the widget will display only first level of depth
2. Show Top Level Page
 - Enables you to select if you want the parent page displayed before children pages. For our “Home Page” example, setting this flag to “Yes”, would make

widget display the following block.

The screenshot shows a dark grey header bar at the top. Below it is the LUMA logo, consisting of a colorful circular icon and the text "LUMA". Underneath the logo is a light grey navigation bar with three links: "Home page", "Women", and "Men". Below the navigation bar is the heading "Home Page". Underneath the heading is the text "CMS homepage content goes here." followed by a blue-bordered box containing a list of items:

- [Home page](#)
 - [Enable Cookies](#)
