Installation instructions

Manual Installation

Before installing the extension, you'll have to:

1. Backup your Magento installation in:
System > Tools > Backups
2. Disable the compiler in your Magento admin panel if it's not already disabled:
System > Tools > Compilations
3. Refresh your cache in:
System > Select cache type > Actions > Refresh > Submit

Now you can install the extension:

1. Download the extension (zip file) from:
Your account > Downloads
2. Once the extension is downloaded, open the folder and unzip it.
3. Copy the content of the unzip folder and paste all files and directories in your Magento root directory (the folder content can vary according to the extension but it generally includes app, lib and skin folders).

Once your installation is complete, don't forget to enable the compiler back (if it was already enabled before the installation) and run compilation process.

Refresh your cache, logout from your admin panel and log back in right after.
